

```
class hello = {
```

```
  #a;
```

```
  #b;
```

```
  constructor (a, b) {
```

```
    hello.a = a;
```

```
  }
```

```
  get hello (a, b) {
```

```
    if ( ) { }
```

```
    ~~~~~
```

```
  }
```

```
  get hello (a, b) {
```

```
    return a, b;
```

```
}
```

So it seems like
assigning a value to a vari.
but it's assigning a
value to a para of constr
of that class. And that
constr is actually referring
getter. so it's like...

```
const say = new hello (a, b);
```

```
say.a = "plabla";
```
