

Validation

(1) Form

submitted when true

could use button type="submit"

→ submit (form)

<form name="myform" ^{??}

onsubmit = "return valForm()">

<input name="myinput">

use
get id

function valForm() {

if (document.forms[^{form name}][^{input name}].value

== "") {

↓ f.name.i.name.

input content

alert("Not Valid."); → alert user

return false; → do NOT submit

} else { return true; }

* e.preventDefault()

e.currentTarget.submit()

use
this

or just use ?

(2) required property

(3) constraint validation

<form>

① document.querySelector

② document.(name).

* form → preventDefault → submit x

<input>

○ ○ ○

① text → .value

② radio → .sum() (array including same name^(?))

form object. username??
what do ya mean?

<check box> option. ☒ ☒ ☐

selectedIndex

.checked

I make form...
input [data-checked]

↓ ??

current.dataset.checked.

WHAT...?
